In 1875, Christopher Sholes with assistance from Amos Densmore rearranged the typewriter keyboard so that the commonest letters were not so close together and the type bars would come from opposite directions. Thus they would not clash together and jam the machine.

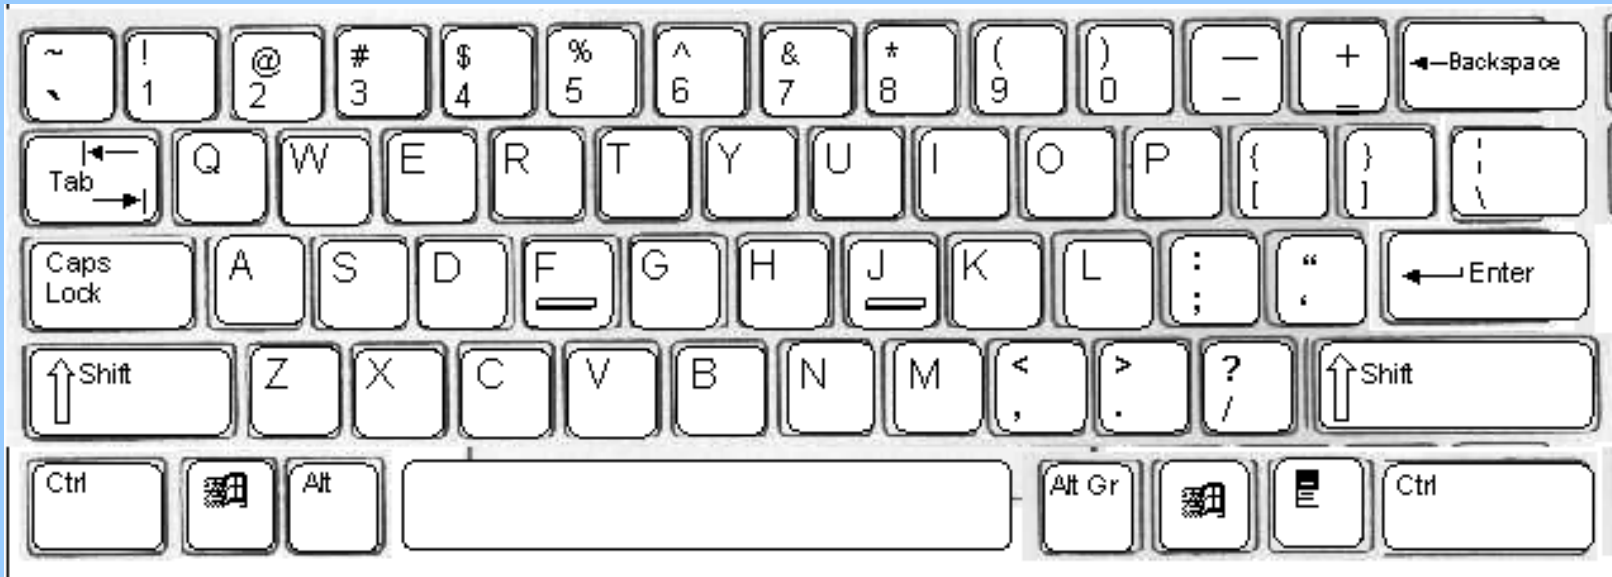

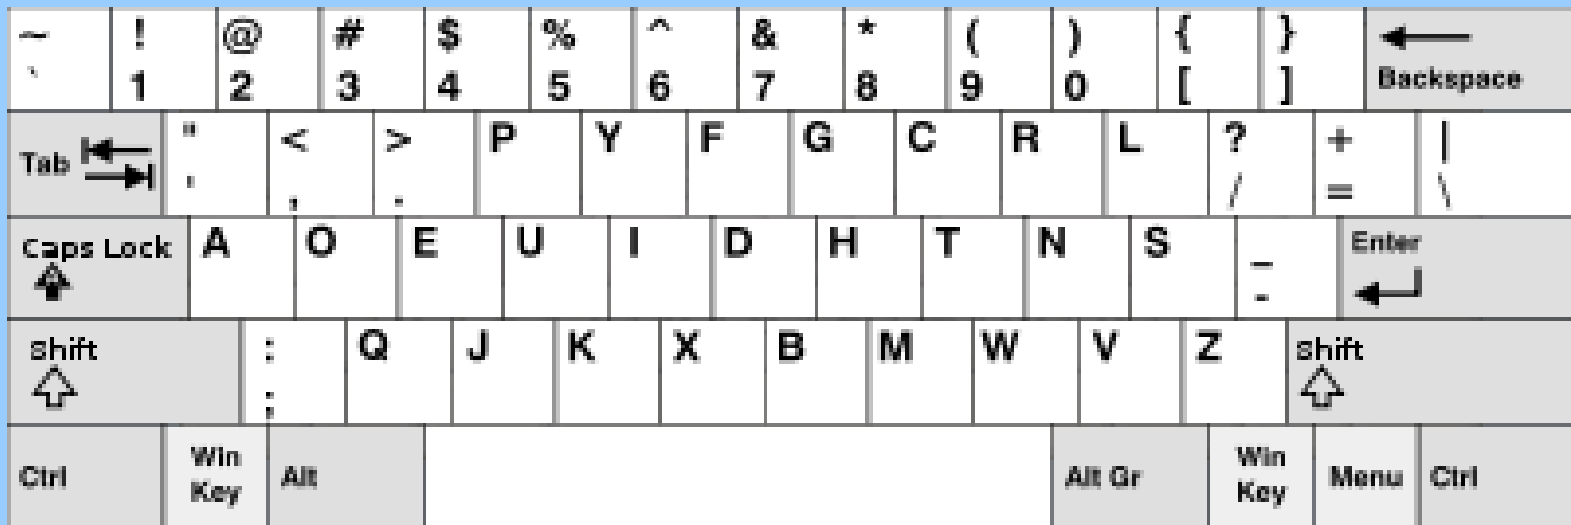

Dr. August Dvorak (1894 –1975) was an educational psychologist and professor of education at the University of Washington in Seattle, Washington.

He and his brother-in-law, Dr. William Dealey, are best known for creating the Dvorak Simplified Keyboard layout in the 1930s as a replacement for the QWERTY layout.

In the 1940s, Dvorak designed keyboard layouts for people with the use of one hand.
